Skills

Programming Languages: Java (*Advanced*), Python (*Advanced*), Kotlin (*Intermediate*), TypeScript (*Intermediate*), JavaScript (*Intermediate*)

Frameworks & Technologies: React Native · Expo (*Intermediate*), React (*Intermediate*), Jetpack Compose (*Intermediate*), Node.js · Express.js (*Intermediate*)

Databases: MySQL (*Advanced*), PostgreSQL (*Intermediate*), MongoDB (*Basic*)

Tools & Version Control: Git · GitHub (*Advanced*), Postman

Core Competencies: Object-Oriented Programming (*Advanced*), REST APIs (*Advanced*), Database Design (*Advanced*), Software Architecture (*Intermediate*), Requirements Analysis (*Intermediate*)

Languages: English (*Fluent*), Spanish (*Native*)

Professional Summary

- Software Engineer with experience in mobile development, backend systems, and applied artificial intelligence projects. Participated in the design and development of applications using Java, Python, Kotlin, and React Native across personal, academic, and research projects, including applications presented to public institutions and computer vision projects developed within an AI and robotics research laboratory. Focused on building clean, scalable, and user-centered solutions by applying engineering judgment at every stage of development.

Experience

Software Developer | Academic Research Role – LIDIAIR, UABCS

Aug. 2025 – Present

- Developed computer vision applications using Python, OpenCV, TensorFlow, and Keras at the Artificial Intelligence and Robotics Research and Development Laboratory (LIDIAIR).
- Contributed to the development of a fruit detection and classification system using image analysis and weight sensor integration for automated price calculation.
- Collaborated on the development of an emotion detection system capable of analyzing facial expressions in real time, classifying emotional states, and exporting result metrics.
- Presented a computer vision-based fruit classification system at an institutional software project exhibition.
- Worked with datasets for training, validation, and evaluation of models used across both projects.

Projects

Lost & Found UABCS – Academic Collaborative Project

May. 2026

- Participated in the design and development of a mobile application for managing lost objects within the university, using Kotlin and Jetpack Compose for the user interface.
- Led requirements analysis, database design, and technical documentation, defining features, user flow, and the overall application structure.
- Implemented most of the mobile frontend and integrated backend services via Retrofit to communicate with a REST API built in Laravel with image storage on AWS S3.
- Worked in a team of four developers using Git and GitHub for coordination, version control, and collaborative development.

Turismo La Paz – Personal Project

Apr. 2026

- Presented the project to representatives of the La Paz City Hall and the Municipal Tourism Department as a technology proposal for the local tourism sector.
- Developed a mobile application to centralize over 40 tourist points of interest across the city, including beaches, museums, viewpoints, and recreational experiences, facilitating destination discovery based on the user's location and preferences.
- Implemented real-time geolocation and distance calculation to sort points of interest by proximity, including filters by experience type and beach category.

- Designed the application using React Native, TypeScript, and Expo, prioritizing performance, user experience and scalability.

Hotel Reservation System – Personal Project

Oct. 2025

- Developed a backend application for managing reservations, guests, rooms, and availability using Java and MySQL.
- Designed and implemented a REST API applying object-oriented programming principles, modular architecture, and relational database modeling.
- Implemented business rules for reservation validation, availability calculation, and management of related entities.
- Applied clean code practices, exception handling, and event logging to improve maintainability, consistency, and scalability.

Education

Bachelor's Degree in Software Development – UABCS

Aug. 2023 – Present

- Training in software engineering, systems architecture, data structures, relational databases, and mobile and backend application development.
- GPA 99/100 (Mexican 100-point scale), with first and second place academic excellence recognitions throughout the degree.
